The Secret to Designing a Modern Kitchen

(your family will love forever)

What's the secret to designing the kind of kitchens people RAVE about?

Here's a hint… It's not the color of the cabinets or the granite.

It's a triangle.

No, not the Bermuda triangle.

Design pros call it "**The Work Triangle**".

Except we hate the word "work". It's a kitchen. You're feeding your family, creating memories. Bonding.

Let's call it the ***Kitchen Triangle*** instead.

When a kitchen is designed with this Triangle in mind. You'll love how it feels. And, how it functions.

The Kitchen Triangle Secret

Everyone loves to look at pictures of kitchens. But what people REALLY love about their kitchen is how well it functions.

In other words, how easy it is to prepare food, cook, socialize, and do homework and all the other things we do in kitchens these days.

The 3 main areas of the kitchen triangle are:

- **Stove/Oven (cooking)**
- **Sink (cleaning)**
- **Fridge (storage)**

Ideally, you want a minimum amount of steps between the 3.

When they're too close together, the kitchen feels cramped. When they're too far apart, it feels cold and empty.

Finding the right balance is the key to optimizing the function of a kitchen.

And while the idea of the "triangle" has been around for years, it's more important than ever given that we practically live in our kitchens these days.

Finding Your Ideal Layout

The traditional kitchen triangle has a few key components:

- The 3 elements should be between 4 & 9 feet apart
- The total length of all three sides should be between 13 & 26 feet
- Cabinets, islands, etc. should only stick 12 inches into the triangle
- No floor-to-ceiling items (such as cabinets) should be inside the triangle
- Avoid directing traffic flow through the triangle

However, after 90 years of doing this, we've found there's no single formula when it comes to finding the optimal layout for a kitchen.

There are just too many variables. And, the way we use kitchens has changed. Dramatically.

That's why it's important to start with a design checklist. That way, you put all the variables in one place.

The 2nd step is to get accurate measurements of your kitchen, pantry and other spaces.

Combining accurate measurements with a thorough assessment of the desired kitchen functions is the key to getting a great design.

After that, you can do the fun stuff. Pick out cabinets, colors, granite, floors, appliances and anything else you need.

The "style" is really the window dressing for a well-designed kitchen. Not the other way around.

Work Zones - The Other Factor

Modern kitchens are designed for much more than just food prep. We practically live in our kitchens.

That's why designers also take into account Work Zones. These are the major areas of activity you want to enjoy in your kitchen.

Examples of Work Zones include:

- Storage
- Prep
- Cooking
- Cleaning
- Entertaining (bar, liquor, etc)
- Homework
- Medication
- Hot beverages (coffee, etc.)
- Family needs (mail, keys, etc.)

These are just a few of the zones that affect what your final kitchen design will look like.

Getting Help Designing Your Kitchen

Kitchen designers spend years in school learning about how to apply concepts like the Triangle and Work Zones to homes like yours.

It's way more involved than looking on Instagram for pictures and picking surfaces. So don't feel bad if the idea of remodeling or designing your kitchen feels overwhelming.

The good news is, you don't have to do it alone.

Our team can help you design AND build a kitchen that suits your family's modern lifestyle. Even if that means you end up with a traditional feel.

It's your kitchen. Build it the way you want. The way that fits your family.

Request a free design consultation today and one of our design professionals will walk you through the process and show you what your kitchen COULD look like.
